                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                           The present sequence is that of orb-weaver spider (Nephila clavipes)
recombinant silk protein, pQE(spl)? The invention provides
methods for purifying and spinning spider silks and other
structural proteins. Organic acids are used to lyse recombinant
cells or other biological samples (such as non-recombinantly
derived cells), and enrich the purity and yields of structural
cells or other biological samples (such as non-recombinantly
the structural proteins intect. In the case of silk proteins, the
proteins by hydrolysing many of the macromolecules while leaving
the structural proteins intect. In the case of silk proteins, the
cresulting lysate is further purified by non-exchange or affinity
chromatography and processed into an aqueous-based mixture for
fibre spinning. In the present case, the pQE(spl) gene was clone
fibre spinning. In the present case, the pQE(spl) gene was clone
fibre spinning. In the present case, the pQE(spl)
and recombinant silk protein was purified using formic acid and
into vector pQE's for recombinant expression in Escherichia coli,
and recombinant silk protein was purified using formic acid and
including films, fibres, woven articles, sutures, ballistic
cof the invention can be used in the construction of many materials
including films, fibres, woven articles, sutures, ballistic
cof the invention and smaller volumes of reagents, results in
better recovery of protein at higher purity (70-99%), is easy to
scale up, and the fibres are spun in an environmentally benign
                                                  Recovering structural polypeptides in a biological sample, useful for purifying and spinning spider silks and other structural proteins, comprises treating the sample containing the polypeptides with an acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 QGAGAAAAAAAAAGGAGQGGYGGLGSQGTSGRGGLGGQGAGAAAAAAAAAAAGGAGQGGY 120

The present sequence is that on the weaver spinler (Weapila Clavipes) recombinant silk protein pGE(SP1)4(SP2)1)4. The invention provides methods for purifying and spinning spider silks and other structural proteins. Organic acids are used to lyse recombinant cells or other biological samples (such as non-recombinantly derived cells), and enrich the purity and yields of structural proteins many of the macromolecules while leaving the structural proteins intact. In the case of silk proteins, the resulting lysate is further purified by ion-exchange or affinity chromography and processed into an aqueous-based mixture for fibre spinning. In the present case, the pQE((SP1)4/(SP2)1)4 gene was cloned into vector pQE-9 for recombinant expression in the propionic acid and anion-exchange chromatography on QAE-Sephadex A50. Products obtained using the methods of the including films, fibres, woven articles, sutures, ballistic products and parachute cords. The new method has the fibre load than an articles, sutures, ballistic required load than an articles of the products of the products of the products of the following advantages over prior articles, the policy of the products of the products of the following advantages over prior articles, the policy of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Recovering structural polypeptides in a biological sample, useful for purifying and spinning spider silks and other structural proteins, comprises treating the sample containing the polypeptides with an acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Indels 12; Gaps

The present sequence is that of orb-weaver spider (Nephila clavipes)

recombinant silk protein pET((SP1)4/(SP2)1)4. The invention

provides methods for purifying and spinning spider silks and other

crels or other biological samples (such as non-recombinantly

cells or other biological samples (such as non-recombinantly

cells or other biological samples (such as non-recombinantly

cells or other biological samples (such as non-recombinantly

the structural proteins intact. In the case of silk proteins, the

resulting lygate is further purified by lon-exchange or affinity

chromatography and processed into an aqueous-based mixture for

thromatography and processed into an aqueous-based mixture for

fibre spinning. In the present case, the pET((SP1)4/(SP2)1)4 gene

was cloned into vector pET34 for recombinant was obtained in

Escherichia coll, and recombinant silk protein was obtained

Scherichia coll, when denaturant (3 M quanidine-HCI) was added

to the propionic acid, the recombinant protein was obtained

to the propionic acid, the recombinant protein was obtained

purity. Products obtained using the methods of the invention can

cut propion articles, stutures, ballistic protection, parachutes

and parachute conds. The new method has the following advantages

cover prior art: it involves fewer steps, requires less time and

smaller volumes of reagents, results in better recovery of protein

at higher purity (70-99%), is easy to scale up, and the fibres are

source miniationmentally benign solution reducing hazardous waste
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recovering structural polypeptides in a biological sample, useful for purifying and spinning spider silks and other structural proteins, comprises treating the sample containing the polypeptides with an acid

The synthetic protein has at least 84% homology with the Nephila claupes spidroin protein and is used to produce synthetic fibres, films and/or membranes, particularly: (1) for medical use, especially to close wounds and/or to support or cover artificial organs; (1) as adhesion surfaces for culturing cells; and (iii) as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and elasticity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New DNA encoding synthetic spider slik protein, useful e.g. for closing wounds, comprises modules that encode repeating units of spidroin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Spidroin; spider; silk; fibre; film; membrane; wound; filter; SOISM12.

                                          to simplify
Also they retain water solubility after long-term boiling in aqueous solutions and since they are also soluble in organic solvents but precipitated at high salt concentration, they are easily extracted and purified. The modular construction of the invention facilitates incorporation of additional peptide-encoding sequences, e.g. to simplification or modulate solubility. This sequence represents the synthetic N. clavipes spidroin-1 homologue SOISMI2 described in the

This sequence represents a synthetic spider dragline variant polymer, CC DP-1A.9. The sequence of the DP-1A.9 monomer is given in AAR99052. CT Pe polypeptide monomer is a variant based on a consensus sequence derived from the fibre forming regions of spider dragline protein, csp. the natural protein 1 (Spidroin 1) from Nephila clavipes.

CC derived from the fibre forming regions of spider dragline protein, csp. the natural protein 1 (Spidroin 1) from Nephila clavipes.

CC DNA sequence encoding the monomer may be used in the recombinant production of the variant protein in a recombinant host, e.g. E. coli or Bacillus subtilis. Synthetic analogues of DP1 were designed to mimic the repeating consensus sequence of the natural protein and the pattern of variation among individual repeats. DP-1A analogues are composed of a tandemly repeated 101 amino acid monomer which comprises four crepeats which differ from the consensus sequence given in AAW06201, according to the pattern (1)-(5) given below. This 101 amino acid monomer is repeated 1-16 times in a series of analogue proteins. The individual repeated 1-16 times in a series of analogue proteins.

(1) the poly-alanine sequence encompassing AGRGGGGGGGARGANGG; colloci state surrounding sequence encompassing AGRGGGGGGGARGANGG; colloci subterior of GTG is a repeat multiples of three consecutive residues; (1) aside from the poly-alanine sequence; deletions usually compass integral multiples of three consecutive residues; (2) a repeat in which the entire poly-alanine sequence is confidence is generally preceded by a repeat containing six alanine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          13;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The proteins may be used to produce fibres of high tensile strength and elasticity, suitable for clothing, rope, surgical sutures, blomaterials for implants, plastic reinforcements, films, coatings, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             50 QGT--SGRGGLGGQGA---GAAAAAAAAGGAGQGGYGGLGSQGTSGRGGLGGQGAGAA 104

The protein improves the moisturizing/softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins, hormones, moisturizers or agents for treating disorders of the skin and hair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cosmetic or dermatological composition containing spider silk protein, for hair or skin care, in make-up or sunscreens

This invention describes a novel DNA sequence, encoding a synthetic spider silk protein, comprising modules, each comprising a group of sequentially arranged obligonucleotide encoding a repeating unit of a spidroin protein. The synthetic protein has at least 84% homology with the Nephila clavipes spidroin protein and is used to produce synthetic fibres, films and/or membranes, particularly: (1) for medical use, especially to close wounds and/or to support or cover artificial organs; (11) as adhesion surfaces for culturing cells; and (11) as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and elasticity).

Also they retain water solubility after long-term boiling in aqueous solutions and since they are also soluble in organic solvents but precipitated at high salt concentration, they are easily extracted and purified. The modular construction of the invention facilitates and construction of the invention facilitates.

Characteristication or modulate solubility. This sequence represents the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New DNA encoding synthetic splder silk protein, useful e.g. for closing wounds, comprises modules that encode repeating units of spidroin

This invention describes a novel DNA sequence, encoding a synthetic spider silk protein, comprising modules, each comprising a group of sequentially arranged oligonucleotides, each oligonucleotide encoding a repeating unit of a spidroin protein. The synthetic protein has at least 84% homology with the Nephila clavipes spidroin protein and is used to produce synthetic fibres, films and/or membranes, particularly: (1) for medical use, especially to close wounds and/or to support or cover artificial organs; (ii) as adhesion surfaces for culturing cells; and artificial organs; (ii) as adhesion surfaces for culturing cells; and (iii) as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to also they retain water solubility after long-term boiling in aqueous solutions and since they are also soluble in organic solvents but precipitated at high salt concentration, they are easily extracted and composed of the modulate solubility. This sequences, e.g. to simplify purification or modulate solubility. This sequence represents a construct composed of the Leak signal peptide—encoding sequences; e.g. to simplify themologue sol, a c-Myc-tag and an endoplasmic reticulum (ER)-retention signal described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    13;

                                                                                                 Q
                        à
                                                                                                                                                                                                                                                                                                                                                                     spider silk protein, comprising modules, each comprising a group of sequentially arranged oligonucleotides, each oligonucleotide encoding a sequentially arranged oligonucleotides, each oligonucleotide encoding a repeating unit of a spidroin protein. The synthetic protein has at clear 1848 homology with the Nephila clavipes spidroin protein and is used to produce synthetic fibres, films and/or membranes, particularly: (1) for medical use, especially to close wounds and/or to support or cover artificial organs; (ii) as adhesion surfaces for culturing cells; and (iii) as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to close with excellent mechanical properties (strength and elasticity). Choso they retain water solubility after long-term boiling in aqueous collutions and since they are also soluble in organic solvents but contributed at high saft concentration, they are easily extracted and purified. The modular construction of the invention facilitates construction of the invention facilitates to incorporation or modulate solubility. This sequences, e.g. to simplify synthetic Northern and sequence represents the construction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 13;

spider silk protein, comprising modules, each comprising a group of sequentially arranged oligonucleotides, each oligonucleotide encoding a repeating unit of a spidonin protein. The synthetic protein has at least 84% homology with the Nephila claylpes spidroin protein and is used to produce synthetic fibres, films and/or membranes, particularly: (1) for medical use, especially to close wounds and/or to support or cover artificial organs; (1i) as adhesion surfaces for culturing cells; and (1ii) as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and elasticity).

Also they retain water solubility after long-term boiling in aqueous solutions and since they are also soluble in organic solvents but precipitated at high saft concentration, they are easily extracted and purified. The modular construction of the invention facilitates incorporation of additional peptide-encoding sequences, e.g. to simplify purification or modulate solubility. This sequence represents the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     13;

A process has been developed for the production of a DNA fragment encoding silk protein. The process involves: (a) selecting target DNA, from a silk producing spider, that contains many repetitive and non-repetitive regions; (b) selecting a single-stranded DNA primer of at least 10 nucleotides with a sequence that is complementary to a region of the target; (c) repetitively combining the primer with melted target

DNA, incubating the mixture with nucleotides and a DNA polymerase with profireading activity to produce a DNA fragment which is complementary to the target and is at least 2 kb long. The present sequence encodes the spider silk protein from Nephila clavipes. The DNA fragment can be used to make fibres, films, woven articles, e.g. for use in parachutes, sails, body armour, and absorbers (e.g. of heavy metals, biological weapons, DNA, chemicals, flavours and fragrances). The high molecular weight (90-250 kD) of spider silk proteins can be produced on a commercial scale (at over 2 g/l cell mass). It has better tensile strength and elasticity than silkworm silk. Inclusion of both repetitive

                                                                                                                                           The present sequence represents the natural spider silk protein spidroine major 1. The protein improves the moisturizing/softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins, hormones, moisturizers or agents for treating disorders of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          in a green plant by providing a green plant containing an SLP expression cassette. The green plant contains the expression cassette P-SLP-T where P is a promoter for driving the expression of an SLP transgene and T is a protein state of the expression of an SLP transgene and T is a proteins in green plants. The silks and silk-like proteins any broteins in green plants. The silks and silk-like proteins may be used in fabrics or in material construction, such as rope, surgical sutures, flexible tie downs for certain electrical components, or as a blomaterial for implantation. The method allows for more cost effective production of silk not obtained from natural or microbial sources. The present sequence is orb-weaving spider spidrolni, a natural silk the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of producing {	t silk-like} proteins (SLP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                210
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           136 GQGAGAAAAAAAA-----AGGAGQGGYGGLGSQCTSGRGGLGGQGAGAAA---- 182

                                                                                                                                                                                                                                                                                                                                The present sequence represents a spider silk protein from the present invention. Spider silk proteins, and peptide fragments within the proteins, can be produced and purified independently and can then be mixed and made into fibres that have higher tensile strengths and elasticity than naturally occurring fibres. The fibres can be used in mixed composites. The invention allows the two naturally occurring Nephila clavipes silk proteins to be produced independently so that they can later be combined to form silk fibres of high tensile strength
                                                                        silk protein; tandem repeat; fibre; dragline; elasticity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention provides isolated CDNA molecules coding for spider silk proteins. The spider silk proteins are characterized by repeating alpha and beta regions and optional variable regions. The DNA sequences are useful in the production of spider silk protein by recombinant DNA techniques. The recombinant spider silk proteins may be used for the production of fibers. The present sequence represents the spider silk protein 1, derived from the major ampullate gland of Nephila clavipes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                원
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 3, Application US/08864038A
Patent No. 6001592
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: NOVEL POLYPEPTIDE GENE CDNA, VECTOR
TITLE OF INVENTION: CONTAINING SAID CDNA, HOST CELLS TRANSFORMED WITH SAID
TITLE OF INVENTION: VECTOR, POLYPEPTIDE PRODUCED THEREBY, METHOD OF PRODUCING
TITLE OF INVENTION: SAID POLYPEPTIDE, DNA ENCODING SAID POLYPEPTIDE AND ANTIBODY
TITLE OF INVENTION: TO SAID POLYPEPTIDE
NUMBER OF SEQUENCES: 4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        10;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

AyObtetical glycine-rich protein Rv0578c - Mycobacterium tuberculosis (strain H37RV) C; Species: Mycobacterium tuberculosis C; Species: Nycobacterium tuberculosis C; Species: Nycobacterium tuberculosis C; Species: Nycobacterium tuberculosis C; Rarris, Dovies, Nycobacterium tuberculosis C; Harris, D; Gordon; C; Davies, R; Devlin, K; Feltwell, T; Gentles, S; Hamilin, N; Holroyd, Rajandream, M.A.: Rogers, J; Rutter, S; Seeger, K; Skelton, Ş; Squares, S. Nature 393, 537-544, 1998
A Attitle: Deciphering the biology of Mycobacterium tuberculosis from the complete geno A; Reference number: A70500; MUID: 98295987; PMID: 9634230
A; Reference number: A70500
A; Redecession: A70934
A; Scatus: preliminary; nucleic acid sequence not shown; translation not shown A; Molecule type: DNA
A; Redeces: GB:AL021942; GB:AL123456; NID: 93242298; PIDN: CAA17449.1; PID: 9290
A; Experimental source: strain H37RV
C; Superfamily: collagen alpha 1(IV) chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    51 GTSGRGGLGGQGAGAAAAAAAAAGGAGGGGYGGLGSQGTS-----GRGGLGGQG-- 100

SUBCELLULAR LOCATION: Cell wall (Potential).
MISCELLANEOUS: THIS PROPEIN CONTAINS 67% GLYCINE RESIDUES.
MISCELLANEOUS: 90% OF THE MATURE PROTEIN RESIDUES ARE CAPABLE OF PORMING A BETA-PLEATED SHEFT COMPOSED OF 8 ANTI-PARALLEL STRANDS.
MISCELLANEOUS: THE GLYCINE-RICH REGION IS COMPRISED OF TWO RELATED FAMILIES OF REPEATS, F1 AND F2, EACH REPEAT CONTAINING ABOUT 40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Condit C.M., Meagher R.B.; "A gene encoding a novel glycine-rich structural protein of petunia."; Nature 323:178-181(1986).
